

The Ratios of a Pentagon

- *Diagonal : Edge*

$$\boxed{\mathbf{d : e = \Phi : 1}}$$
 where $\Phi = \frac{1 + \sqrt{5}}{2}$

(See the proof under “The Golden Ratio and the Pentagon” in the 10th Grade *Sequences and Series* unit.)

- *Circumradius : Short-chord* (which is YD)

Because $\triangle ODY \sim \triangle ACD$ we can show that $\boxed{\mathbf{r : YD = \Phi : 1}}$

- *Circumradius : Edge*

$$\angle ADY = 90^\circ \rightarrow AY^2 = AD^2 + YD^2$$

and since $AY = 2r$; $AD = \Phi e$; $YD = r/\Phi$

$$\text{we get } (2r)^2 = (\Phi e)^2 + (r/\Phi)^2$$

which leads to $r : e = \frac{\Phi^2}{\sqrt{4\Phi^2 - 1}} : 1$

and eventually simplifies to $\boxed{\mathbf{r : e = \frac{\sqrt{50+10\sqrt{5}}}{10} : 1}}$ and the reciprocal is $\boxed{\mathbf{e : r = \frac{\sqrt{10-2\sqrt{5}}}{2} : 1}}$

- *Inradius : Edge* (The “Inradius”, shown as h, is the radius of the inscribed circle)

Using the right $\triangle OXD$, we get $OD^2 = XD^2 + OX^2$

and since $OX = h$; $XD = \frac{1}{2}e$; $OD = r = e \cdot \frac{\sqrt{50+10\sqrt{5}}}{10}$

we get $\left(\frac{e\sqrt{50+10\sqrt{5}}}{10}\right)^2 = (\frac{1}{2}e)^2 + h^2$ which eventually simplifies to $\boxed{\mathbf{h : e = \frac{\sqrt{25+10\sqrt{5}}}{10} : 1}}$

- *Circumradius : Inradius*

Given the above two ratios, we can say $r : h = \frac{\sqrt{50+10\sqrt{5}}}{10} : \frac{\sqrt{25+10\sqrt{5}}}{10}$

which eventually simplifies to $r : h = \sqrt{6-2\sqrt{5}} : 1$ which, in this case, can be simplified

using Bhāskara’s Identity¹ to $\boxed{\mathbf{r : h = (\sqrt{5}-1) : 1}}$ with a reciprocal of $\boxed{\mathbf{h : r = \frac{1+\sqrt{5}}{4} : 1}}$

- *Mid-diagonal : Circumradius* (The “Mid-diagonal” is shown as k)

Because $\triangle BOY \sim \triangle AED$ we can show that $\boxed{\mathbf{k : r = \Phi : 1}}$

- *Mid-diagonal : Edge*

Since $k = \Phi \cdot r$, we can use the above ratio we found for $r : e$, multiply it by Φ ,

and after simplifying, we get $\boxed{\mathbf{k : e = \frac{\sqrt{25+10\sqrt{5}}}{5} : 1}}$

- *Mid-diagonal : Inradius*

Comparing the above ratios $k : e$ and $h : e$ we can now conclude that $\boxed{\mathbf{k : h = 2 : 1}}$

¹ Bhāskara’s Identity is $\sqrt{a \pm \sqrt{b}} \equiv \sqrt{\frac{a+x}{2}} \pm \sqrt{\frac{a-x}{2}}$ where $x = \sqrt{a^2 - b}$

This allows us to simplify a compound radical of the form $\sqrt{a \pm \sqrt{b}}$ if $a^2 - b$ turns out to be a perfect square.

With the problem at hand, $\sqrt{6-2\sqrt{5}}$, which is the same as $\sqrt{6-\sqrt{20}}$, $a^2 - b = 16$, so $x = 4$. Bhāskara’s Identity

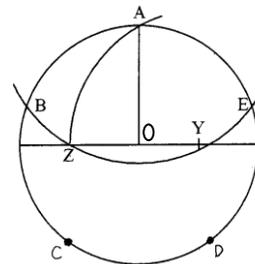

then gives us $\sqrt{\frac{6+4}{2}} - \sqrt{\frac{6-4}{2}}$ which simplifies to $\sqrt{5} - 1$. With most other compound radicals, such as

$\sqrt{25-10\sqrt{5}}$, which is the same as $\sqrt{25-\sqrt{500}}$, $a^2 - b$ is not a perfect square, so Bhāskara’s Identity is not helpful.

Various Methods for Constructing a Pentagon

Ptolemy's Construction (ca. 150AD)

Construction: Draw a horizontal diameter and find the midpoint, Y, of the radius. A is located vertically above the center. Find Z on the diameter by drawing an arc through A with Y as the center. AZ is the desired length of the edge of the pentagon.

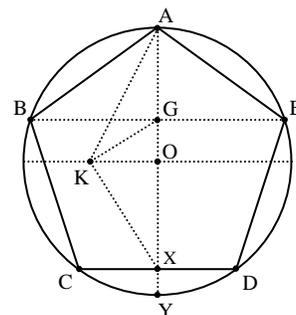

To Prove: If the radius of the circle is 1, then $AZ = \frac{\sqrt{10-2\sqrt{5}}}{2}$, which is the required length of the edge of the pentagon. (See "The Ratios of a Pentagon" on the previous page.)

Proof: $AY^2 = AO^2 + OY^2 \rightarrow AY^2 = 1^2 + (\frac{1}{2})^2 \rightarrow AY = \frac{\sqrt{5}}{2}$ $AY = ZY$ and $OZ = ZY - OY \rightarrow OZ = \frac{\sqrt{5}-1}{2}$
 $AZ^2 = AO^2 + OZ^2 \rightarrow AZ^2 = 1^2 + (\frac{\sqrt{5}-1}{2})^2$ which leads to $AZ = \frac{\sqrt{10-2\sqrt{5}}}{2}$ Q.E.D.

Richmond's Construction (by H. W. Richmond in 1893)

Construction: Draw a horizontal diameter and then find the midpoint, K, of the radius. Draw a vertical diameter to locate points Y and A (the first point of the pentagon) on the circle. Bisect $\angle AKO$ and mark G where the bisector crosses AO. Bisect the external angle to $\angle AKO$ (i.e., bisect the angle formed by KO and AK extended) and mark X where this bisector crosses OY. (Note that $\angle GKX$ is a right angle.) Draw horizontal lines through points G and X in order to locate the four remaining points of the pentagon.

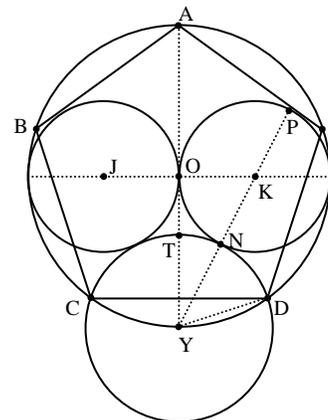

To Prove: If the radius of the circle is 1, the lengths of the five edges of the pentagon ABCDE are all equal to $\frac{1}{2} \cdot \sqrt{10-2\sqrt{5}}$. (See "The Ratios of a Pentagon" on the previous page.)

Proof: Using $\triangle KAO$, if we let $AO = 1$ then $OK = \frac{1}{2}$ and $AK = \frac{\sqrt{5}}{2}$ Using the Triangle Angle-Bisector Theorem, we get $AG : OG = AK : OK = \sqrt{5} : 1$. Using Euclid V-18 $\rightarrow (AG + OG) : OG = (\sqrt{5} + 1) : 1$ which gives us $AO : OG = (\sqrt{5} + 1) : 1 \rightarrow OG = \frac{\sqrt{5}-1}{4}$ and $AG = AO - OG \rightarrow AG = \frac{5-\sqrt{5}}{4}$
 BG is a leg to two right triangles $\rightarrow BG^2 = BO^2 - OG^2 = AB^2 - AG^2 \rightarrow AB^2 = BO^2 - OG^2 + AG^2$
 which gives us $AB^2 = 1^2 - (\frac{\sqrt{5}-1}{4})^2 + (\frac{5-\sqrt{5}}{4})^2$ Solving for AB gives the desired $AB = \frac{\sqrt{10-2\sqrt{5}}}{2}$
 We can now use the *Altitude of the Hypotenuse Theorem* with the right $\triangle GKX \rightarrow KO^2 = OG \cdot OX$
 Now $\frac{1}{4} = \frac{\sqrt{5}-1}{4} \cdot OX \rightarrow OX = \frac{\sqrt{5}+1}{4}$ Using right $\triangle OXC$ leads to $CX = \frac{\sqrt{10-2\sqrt{5}}}{4}$ and $CD = \frac{\sqrt{10-2\sqrt{5}}}{2}$
 It can then be shown that the rest of the edges of the pentagon also have the same length. Q.E.D.

Hirano's Construction (by Yosifusa Hirano in the 19th century)

Construction: Along the horizontal diameter of the given circle, draw two half-sized circles (with centers J and K). Draw line YK intersecting the half-sized circle at points N and P. Using Y as the center, and YN as the radius, draw a circle, which locates points C and D on the original circle. Using Y as the center, and YP as the radius, draw an arc (not shown), which locates points B and E on the original circle. ABCDE is the desired regular pentagon.

To Prove: The short-chord (YD) and the mid-diagonal (YE) are both in the required ratio to the radius (OY) so that the pentagon can be regular. (See "The Ratios of a Pentagon" on the previous page.)

Proof: If we let $OY = 1$, then $NK = OK = \frac{1}{2}$; $YK = \sqrt{5}/2$; $YD = YN = \frac{\sqrt{5}-1}{2}$

Therefore $YD : OY = \frac{\sqrt{5}-1}{2} : 1$ which is also $OY : YD = \frac{\sqrt{5}+1}{2} : 1 = \Phi : 1$, as required.

$YE = YP = \frac{1}{2} + \frac{1}{2} + \frac{\sqrt{5}-1}{2} = \frac{\sqrt{5}+1}{2}$. Therefore $YE : OY = \frac{\sqrt{5}+1}{2} : 1 = \Phi : 1$, as required. Q.E.D.
